# Jason Ngo

Computer Science Major @ UBC
+1 587-890-5411 | work@jasonn.dev | github.com/Green-Avocado | www.jasonn.dev

## Skills Summary

| | |
|---|---|
| **Application Security** | Buffer overflow, Format-string exploits, Return-oriented programming, Use-after-free |
| **Web Security** | SQL injection, Cross-site scripting, Template injection, Local file inclusion, Prototype pollution |
| **Systems development** | Rust, x86 Assembly, C / C++, Java |
| **Web development** | NodeJS, REST APIs, NGINX, Google Firebase |
| **System administration** | Linux, Docker, SQL |

## Work Experience

**2020/04 - 2022-02** **Freelance Software Development**

- Designed proof-of-concepts for database solutions using Firebase Realtime Database, MySQL, and Google Drive APIs.
- Developed a web application to read data from a CSV file and display prayer times using HTML, CSS, and JavaScript.
- Wrote scripts to load current COVID-19 statistics into Google Sheets and send emails to a list of subscribers for covidping.com to notify users of COVID-19 statistics in their state.

## Technical Extracurriculars

**2019/09 - Present** **CTF Competitions**
*https://github.com/Green-Avocado/CTF*

- Reverse engineered binaries without symbols using Ghidra and Radare2.
- Performed dynamic analysis and debugged exploits using GDB.
- Identified vulnerabilities in binary applications and web services.
- Defeated common exploit mitigations such as position independent executables, address-space layout randomization, stack canaries, and relocation read-only.
- Created writeups to explain vulnerabilities and exploit techniques used in each challenge.

**2017/09 - 2020/02** **Vex Robotics Club**
*https://github.com/Green-Avocado/3388D-vex-robotics-edr-2020*

- Wrote firmware in C++ which used the Vex API to receive instructions from a controller.
- Used feedback from sensor data to guide autonomous routines and aid user control.
- Created a user interface for the controller display screen to configure the robot at runtime.
- Our team won a programming award and we were invited to compete in the international event.

## Hackathon Projects

**2022/01** **Language Exchange**
*https://github.com/Green-Avocado/Language-Exchange*

- Created a website using React and NodeJS in a team of 4 for connecting language students with complementary strengths and goals.

**2021/11** **Speak-able**
*https://devpost.com/software/speak-able-inclusive-unconferencing*

- Created a website using NodeJS in a team of 4 for encouraging inclusivity in participant-driven meetings.

**2020/08** **Study Tinder**
*https://devpost.com/software/study-tinder*

- Worked in a team of 2 to create a website for helping students connect and help each other study while social distancing.

**2020/08** **BikePath**
*https://devpost.com/software/bikepath-dkpstx*
- Worked in a team of 3 to create a website to help users find alternative locations that would permit eco-friendly alternatives to driving, such as walking or biking.

**2020/08** **COVID Wait**
*https://devpost.com/software/covid-wait*
- Worked in a team of 5 to create a website to help users avoid highly populated areas and reduce the risk of exposure to COVID-19.

## Cybersecurity Projects

**2021/03 - Present** **pwndocker**
*https://github.com/Green-Avocado/pwndocker*
- Wrote a minimal program in C to create symbolic links without standard libraries.
- Used Docker and gdbserver to create an environment for debugging exploits.
- The project is frequently used by myself in CTF competitions.

**2022/02** **BBY Stealer Malware Analysis**
*https://github.com/Green-Avocado/bbystealer-malware-analysis*
- Performed dynamic analysis using Wireshark and Windows filesystem auditing to identify files read or modified and external connections.
- Reverse engineered JavaScript code that was obfuscated using obfuscator.io and packaged as a Windows executable using nexe.
- Helped affected victims with incident response by identifying compromised credentials and modified files.

**2021/10 - 2022/01** **UBC MapleCTF**
*https://github.com/ubcctf/maple-ctf-ubc-2022*
- Wrote challenges in C with intentional vulnerabilities to progressively introduce and test binary exploitation techniques.
- Used Docker to containerize challenges so they could be deployed through Kubernetes.
- Helped beginners by running demonstrations at a workshop and answering questions related to binary exploitation and reverse engineering.

**2021/09 - 2021/12** **EasyROP**
*https://github.com/Green-Avocado/EasyROP*
- Wrote a program in Java to automate writing scripts for binary exploitation.
- The project began as a command-line application and later included a graphical user interface which was developed using Java Swing.
- Return-oriented programming payloads could be saved as a local JSON file and reloaded.

## Personal Projects

**2020/12 - Present** **website**
*https://github.com/Green-Avocado/website*
- Used NodeJS with Express to serve web pages which are generated using a templating engine.
- Set up a reverse proxy using NGINX which secures connections using TLS and forwards requests to internal services.
- Used Docker to containerize internal services, allowing each service to be modified and restarted independently.
- Tested the website and scanned for vulnerabilities using continuous integration.

**2021/11 - 2022/01** **atom-ide-rust**
*https://github.com/rust-lang/atom-ide-rust*
- Contributed to an open source plugin for integrating rust-analyzer into the Atom text editor.
- Used NodeJS to read config files, parse JSON data, and interface with a language server.
- Wrote documentation using markdown to explain the usage of the plugin with examples.
- The plugin has been downloaded over 164 000 times.

**2021/12** **discord-balance-tracker**
*https://github.com/Green-Avocado/discord-balance-tracker*

- Wrote a Rust application to track balances of users on Discord.
- Used asynchronous programming to interact with the Discord API for sending and receiving interactions.
- The application was used by my roommates and myself to keep track of our shared finances.

**2021/03** **Etwahl**
*https://github.com/Green-Avocado/Etwahl*

- Wrote a program in C++ to bind signals from an electronic piano to simulated keypresses.
- Received MIDI signals over a USB connection using the open source RtMidi library.
- Used CMake, X11 libraries, and Windows libraries to develop a multi-platform application.

## Awards

**2022/01** CyberSci Vancouver Regionals - First Place

**2020/03** Vex EDR Alberta Provincial Tournament - Think Award

**2019/04** U of Calgary Science Engineering and Technology Challenge - First Place

## Education

**2020/09 - 2024/04** **Bachelor of Science, Major in Computer Science**
*University of British Columbia, Vancouver, BC*
